

Part 1: Backend & Database (API Focus)

Task 1: Identity & Access Management (Auth Architect)

- **Database:** Design `users` table and implement Roles/Permissions (Admin, Employer, Candidate) using **Spatie**.
- **Logic:** Build APIs for Registration, Login (using **Sanctum** or **JWT**), and Logout.
- **Security:** Create Middlewares to protect routes based on User Role (e.g., only Employers can access the "Post Job" endpoint).

Task 2: Job Lifecycle Engine (CRUD & Approval)

- **Database:** Design `categories`, `jobs`, and `job_skills` tables.
- **Logic:** Build CRUD APIs for jobs (Create, Read, Update, Delete).
- **Workflow:** Implement the "Approval Logic"—jobs are created with a `pending` status and remain hidden from the public until an Admin switches them to `approved`.

Task 3: Application Logic & Media Handling

- **Database:** Design the `applications` table to link Candidates to Jobs.
- **Logic:** Build the "Apply" API, ensuring a candidate cannot apply for the same job twice.
- **Storage:** Implement **Laravel Storage** for uploading and retrieving Resumes (PDFs) and Company Logos.

Task 4: Advanced Filtering & Search Engine

- **Logic:** Develop a high-performance Search API using **Eloquent Scopes**.
- **Features:** Implement filtering by Keywords, Location, Category, Salary Range, and Work Type (Remote/On-site).
- **Sorting:** Add logic to sort results by "Most Recent" or "Salary Level."

Task 5: Payments, Comments & Analytics

- **Integrations:** Integrate **Stripe** or **PayPal** SDKs to handle employer payments (pay-per-hire or unlock contact details).
 - **Logic:** Build APIs for the Comment system (Post/Delete) and an Analytics endpoint to return counts (e.g., total applicants, job views).
-

Part 2: Frontend & UI (Vue.js Focus)

Task 6: Authentication & Profile UI

- **Auth:** Build Login and Registration pages, integrating them with the Backend API.
- **Profiles:** Design "Edit Profile" pages for both Employers (Company info) and Candidates (Resume upload/Skills).

- **State:** Manage user sessions using **Pinia** (or Vuex).

Task 7: Job Posting & Management UI

- **Forms:** Create the "Post a Job" form with comprehensive validation (Title, Requirements, Skills).
- **Management:** Build a dashboard for Employers to see a list of their posted jobs with options to Edit or Delete.

Task 8: Job Explorer & Search UI

- **Listings:** Design the "Job Feed" (Cards layout) and the "Job Detail" page.
- **Search:** Build a dynamic Filter Sidebar that updates job results in real-time as the user selects criteria.

Task 9: Application Tracking UI

- **Employer View:** A dedicated UI for employers to review applicants, download resumes, and click "Accept" or "Reject."
- **Candidate View:** A "My Applications" page for candidates to track the status of their submissions.

Task 10: Admin Dashboard & Interaction UI

- **Moderation:** Build the Admin panel to review and Approve/Reject pending job posts.
 - **Engagement:** Design the Notifications bell and the Comment section on job pages.
 - **Data:** Implement **Chart.js** to visualize platform activity (Sign-ups, Jobs, Revenue).
-
